FOREWORD

This paper on Changes in Characteristics of Portland Cement as Exhibited by Laboratory Tests Over the Period 1904 to 1950, was presented at the Fifty-Fourth annual meeting of the Society held in Atlantic City, N.J., June 21, 1951. It contains information that is of direct interest to our Committee C-1 on Cement. It is, therefore, of such a nature that the Administrative Committee on Papers and Publications felt that it should be printed as a special technical publication.

NOTE.—The Society is not responsible, as a body, for the statements
and opinions advanced in this publication.

THIS PUBLICATION is one of many issued by the American Society for Testing Materials in connection with its work of promoting knowledge of the properties of materials and developing standard specifications and tests for materials. Over the years the Society has published many technical symposiums, reports, and special books. These may consist of a series of technical papers, reports by the A.S.T.M. technical committees, or compilations of data developed in special Society groups with many organizations cooperating. A list of A.S.T.M. publications and information on the work of the Society will be furnished on request.
