## FOREWORD

These two papers and their discussions were presented at the Spring Meeting of the American Society for Testing Materials, February 26, 1946, in Pittsburgh, Pa. Arrangements for the session were made by the Pittsburgh District Committee, headed by Thomas Spooner, chairman, and P. G. McVetty, secretary, both of Westinghouse Electric Corp., assisted by F. T. Mavis, Carnegie Institute of Technology. H. F. Dodge, Bell Telephone Laboratories, Inc., acted as chairman of the session.

The widespread application of statistical quality control methods during the war years testifies to the increasing importance of quality control in production. The authors of these papers are outstanding authorities in this field, and their contributions should prove to be of great value to industry.
