

# Subject Index

## A

Abstract factor analysis, 156, 157–160, 163–165  
 Additive mixtures, classification of, 13  
 American Cyanamid, 2  
 Analytical chemistry, 1, 6  
 ASTM E 168, 1, 4

## B

Band ratio methods, 128  
 Beer's law, 22, 25, 38, 59, 101, 120, 122, 167  
   methods to include nonlinearities in quantitative spectral analysis, 78–93  
   quantitative infrared analysis, 95  
   sources of apparent deviation from, 38, 40  
 Blood serum, use of computerized quantitative infrared spectroscopy to determine lipids in, 131–154

## C

Chemistry, 1  
 C-matrix, 19  
 Computerized infrared spectroscopy  
   applications of, in petroleum industry, 4, 36–57  
   use of, for novel quantitative polymer analysis, 58–76

  use of, to determine lipids in blood serum, 131–154

Computerized techniques, use of, to carry out multicomponent analysis infrared methods, 4–5

Cross validation, 159

## D

Deuterated triglycine sulfate (DTGS) detectors, 2  
 Difference spectroscopy, use of, in quantitative analysis, 71–74  
 Diffuse reflectance, 123–126  
 Diffuse reflectance infrared spectra, 59–67  
 Double beam infrared spectrometer, introduction of, 2

## E

Eigenvector space, generalized plot of, 31

## F

Factor analysis  
   potential of, in infrared spectroscopy, 155  
   use of, in quantitative spectroscopic applications, 5  
 Fluorescence emission-excitation matrices (EEMs), application of, in analytical chemistry, 26–28, 32–33  
 Fourier deconvolution, 50–53, 170

Fourier transform infrared (FT-IR) spectrometers, 79  
 effect of, on standard setting, 3-4  
 evolution of, 2  
 introduction of, 37  
 use of, for complex samples, 95-129  
   appropriate calibration samples, 109-110  
   back-calculation of original concentration, 99-100  
   diffuse reflectance, 123-126  
   future developments, 128  
   **K**-matrix approach, 97-103  
   microsampling, 127  
   minor component analysis, 110-116  
   photoacoustic spectroscopy, 123, 126-127  
   **P**-matrix approach, 103-106  
   reproducible sample handling, 127-128  
   theory, 96-97

## G

Gas chromatography (GC) method, replacement of infrared methods by, 2, 37  
 Gaussian distribution, 8  
 Generalized standard addition method (GSAM), use of, in multicomponent calibration, 18-26

## I

Infrared difference spectroscopy  
   applications of, 38  
   history of developments in, 4, 6-35  
   need for caution in use of computers in, 169-178

potential of factor analysis in, 155  
 International Union of Pure and Applied Chemistry (IUPAC), 40

## K

Key-set analysis, 165  
 Kirchoff's law, 74  
**K**-matrix analysis, 4, 12, 14-21, 37, 97-99, 107, 113-114, 116  
   back-calculation of original concentrations, 99-100  
   calibration with mixtures, 110  
   dealing with spectral overlap, 139-141  
   diffuse reflectance, 123  
   future of, 128  
   intercepts in, 101  
   limitations to, 101-103  
   overdetermination in, 100  
 Kubelka-Munk function, 64-65

## L

Least squares method, use of, to estimate position of calibration line, 8  
 Least squares multiple regression, application of, in analytical chemistry, 27  
 Lipids, use of computerized quantitative infrared spectroscopy to determine, in blood serum, 131-154

## M

Mercury-cadmium telluride (MCT) detector, 2  
 Micro (IRS) internal reflection spectroscopy, 54-55

- Microprocessor technology, incorporation of, into infrared instruments, 2
- Microsampling, 127
- Multicomponent analysis infrared methods, use of computerized techniques, 4-5
- Multicomponent analysis of lipids, 139
- Multicomponent bilinear models
  - use of, in infrared quantitative analysis, 26-33
    - least squares multiple regression, 27
    - rank annihilation, 27-28
    - self-modeling curve resolution, 29-33
- Multi-component linear model
  - use of, in infrared quantitative analysis, 11-26
    - calibration, 13-21
    - deterministic errors, 23-26
    - quantitation, 21-23
    - sample classification, 12-13
- Multivariate least-squares calibration, 79, 91

## N

- Novel quantitative polymer analysis, use of computerized infrared spectroscopy for, 58-76
- Nuclear magnetic resonance (NMR) spectroscopy, replacement of infrared methods by, 37

## O

- Optical null double beam instruments, 2

- Overdetermination, importance of, 106-109

## P

- Partial least squares (PLS), use of, in multicomponent calibration, 16-18
- Perkin-Elmer, 2
- Petroleum products, application of computer-assisted quantitative infrared spectroscopy to, 4, 36-57
- Photoacoustic spectroscopy (PAS), 64, 66-67, 123-127
  - sample handling in, 127-128
- P-matrix analysis, 4, 82, 103-104, 116
  - advantages of, 104-105
  - calibration with mixtures, 110
  - dealing with spectral overlap, 141-142
  - future of, 128
  - limitations to, 105-106
- Polymer films, thermal radiative properties of, 74-76

## Q

- Q-matrix approach, 4-5, 133
  - dealing with spectral overlap, 142-146
  - lipid analysis data obtained with, 146-153
- Quantitative absorption spectroscopy
  - application of target factor analysis to, 155-167
  - data manipulation in, 67-71
  - difference spectroscopy in, 71-74
  - methods for including Beer's law nonlinearities in, 78-93
  - use of factor analysis in, 5

**R**

- Rank annihilation, application of, in analytical chemistry, 27–28
- Resolution enhancement (deconvolution), 36
- R**-matrix, 19
- Root-mean-square (RMS) difference, 158

**S**

- Self-modeling curve resolution, application of, in analytical chemistry, 29–33
- Single component linear model, use of, in infrared quantitative analysis, 7–11
  - deterministic error, 10–11
  - random error, 8–10
- Spectral stripping, 36
- Spectral subtraction, 42, 44–45, 47, 170–171
- Spectroscopic determinations, need for caution in use of computers in, 5, 169–178

**T**

- Target factor analysis, application of, to quantitative absorption spectroscopy, 155–167
- Thermal radiative properties, of polymer films, 74–76
- Tyndall scattering, 40

**V**

- Variable subtraction, 47–50
- V**-matrix, 22–23

**W**

- Weighted least squares regression, 9, 10

**Z**

- Zero transmittance point, location of, 2
- Z**-matrix, 156
