Authorization to photocopy items for internal, personal, or educational classroom use, or the internal, personal, or educational classroom use of specific clients, is granted by ASTM International provided that the appropriate fee is paid to the Copyright Clearance Center, 222 Rosewood Drive, Danvers, MA 01923, Tel: (978) 646-2600; <http://www.copyright.com/>

The Society is not responsible, as a body, for the statements and opinions expressed in this publication. ASTM International does not endorse any products represented in this publication.

Peer Review Policy

Each paper published in this volume was evaluated by two peer reviewers and at least one editor. The authors addressed all of the reviewers' comments to the satisfaction of both the technical editor(s) and the ASTM International Committee on Publications.

The quality of the papers in this publication reflects not only the obvious efforts of the authors and the technical editor(s), but also the work of the peer reviewers. In keeping with long-standing publication practices, ASTM International maintains the anonymity of the peer reviewers. The ASTM International Committee on Publications acknowledges with appreciation their dedication and contribution of time and effort on behalf of ASTM International.

Citation of Papers

When citing papers from this publication, the appropriate citation includes the paper authors, "paper title," STP title, STP number, book editor(s), ASTM International, West Conshohocken, PA, year, page range, Paper doi, listed in the footnote of the paper. A citation is provided on page one of each paper.

Foreword

THIS COMPILATION OF Selected Technical Papers, STP1596, *Flammability and Sensitivity of Materials in Oxygen-Enriched Atmospheres: 14th Volume*, contains peer-reviewed papers that were presented at a symposium held April 13–15, 2016, in San Antonio, Texas, USA. The symposium was sponsored by ASTM International Committee G04 on Compatibility and Sensitivity of Materials in Oxygen Enriched Atmospheres.

Symposium Chairpersons and STP Editors:

Samuel Edgar Davis

Contents

Overview	ix
Keynote Address	
Space Exploration and Fire Technology at Southwest Research Institute—Learning from the Past and Preparing for the Future	1
Walter D. Downing	
Test Methods	
A Method for Autogenous Ignition Temperature Determination of Metal Through Induction Heating	15
Joel Stoltzfus and Timothy D. Gallus	
Statistical Considerations for Adiabatic Compression Testing	37
Barry E. Newton and Theodore A. Steinberg	
Improved ASTM G72 Test Method for Ensuring Adequate Fuel-to-Oxidizer Ratios	49
Alfredo Juarez and Susana A. Harper	
Autogenous Ignition Test Approach for Hyperbaric Oxygen (HBO₂) and Other Low-Pressure Oxygen Applications	62
Gwenael J. Chiffolleau, Richard Barry, Barry E. Newton, and Nicholas Linley	
Cleaning and Contamination Control	
Results of the Test Program for Replacement of AK-225G Solvent for Cleaning NASA Propulsion Oxygen Systems	76
Nikki M. Lowrey and Mark A. Mitchell	
NASA Independent Assessment of Ambient Pressure Liquid Oxygen (LOX) Impact Testing of Halogenated Solvents	109
H. R. Ross and S. J. Gentz	

An Improved Approach for Analyzing the Oxygen Compatibility of Solvents and Other Oxygen-Flammable Materials for Use in Oxygen Systems	137
Susana A. Harper, Alfredo Juarez, Stephen F. Peralta, Joel Stoltzfus, Christina Piña Arpin, and Harold D. Beeson	
Analysis of Risks to Oxygen Systems from Particulate and Fiber Contaminants and Derivation of Cleanliness Requirements	152
Nikki M. Lowrey	
Factors Affecting NVR Contaminant Fire Risk	185
Bradley S. Forsyth, Gwenael J. A. Chiffolleau, Barry E. Newton	
Failure and Incident Investigations	
Fatal Accident from an Oxygen Fire in an Indian Steel Plant in 2012: Unresolved Questions	205
Kanchan Chowdhury	
Auto Ignition Temperature Test Chamber Fire Investigation	234
Jonathan M. Tylka and Timothy D. Gallus	
Investigation of a Fire in a Liquid Oxygen Bulk Delivery Tank	246
Barry E. Newton and John Schumacher	
Failure Analysis of a Liquid Oxygen Gate Valve Fire	265
Gwenael J. A. Chiffolleau, Elliot T. Forsyth, and Barry E. Newton	
Stainless Steel Plug Valve Incident in High Pressure Oxygen: Delrin® Seat and Silicone-Based Lubricant	286
Jared D. Hooser, Bradley S. Forsyth, Gwenael J. A. Chiffolleau, and Barry E. Newton	
Research on Materials and Operations	
Properties of ToughMet® 3 Copper-Nickel-Tin Alloy for Oxygen Enriched Atmosphere Applications	296
Anand V. Samant, Michael J. Gedeon, Robert E. Kusner, Chad A. Finkbeiner, Fritz C. Gensing, and W. Raymond Cribb	
Detailed Investigation of the Sequence of Mechanisms Participating in Metals Ignition in Oxygen Using Laser Heating and In Situ, Real-Time Diagnostics	308
Maryse Muller, Hazem El-Rabii, Rémy Fabbro, Frédéric Coste, Jean-Christophe Rostaing, Martina Ridlova, Alain Colson, and Hervé Barthélémy	
Comparison of Combustion Products of Bulk Aluminum Rods Burning in High Pressure Oxygen in Normal and Reduced Gravity	326
Owen Plagens and Theodore A. Steinberg	
Simulation of Cylindrical Rod Combustion in High-Pressure Oxygen by Steady-State Jet Model	338
S. I. Shabunya, V. V. Martynenko, V. I. Ignatenko, and J.-C. Rostaing	

Evaluation of Containment Boxes as a Fire Mitigation Method in Elevated Oxygen Conditions	363
Alfredo Juarez, Susana A. Harper, and Horacio Perez	
Promoted Ignition-Combustion Tests of Brazed Aluminum Heat Exchanger Samples in Cold Supercritical Oxygen	374
Thomas A. McNamara, Joseph F. Million, Ravi Pahade, and James White	
Oxygen Endurance Testing of Oxygen Cylinder Valves	393
T. Kasch, C. Binder, N. Treisch, M. Szykowski, and A. Woitzek	
Evaluation of a Near-Adiabatic Compression Process to Increase Fire Safety Within Oxygen Systems, Focusing on Non-Metals	405
Maria Ryan, Theodore A. Steinberg, and Barry E. Newton	
Oxygen Partial Pressure and Oxygen Concentration Flammability: Can They Be Correlated?	413
Susana A. Harper, Alfredo Juarez, Horacio Perez III, David B. Hirsch, and Harold D. Beeson	

Overview

STP1596 is the fourteenth set of Special Technical Papers (STP) originating from the ASTM Committee G04 focusing on the *Flammability and Sensitivity of Materials in Oxygen-Enriched Atmospheres*. The thirteen previous STP volumes originating from the ASTM G04 committee are: 812, 910, 986, 1040, 1111, 1197, 1267, 1319, 1395, 1454, 1479, 1522, and 1561. Copies of these STP volumes are available from ASTM International.

The ASTM Committee G04 on Compatibility and Sensitivity of Materials in Oxygen Enriched Atmospheres continues to grow in its international appeal. The fourteenth symposium was attended by a number of professionals representing several countries. These included the United States, Australia, Germany, Canada, France, India, the United Kingdom, and Belarus. A number of professionals from other nations also attended the symposium and shared important information in person even though they were unable to submit a formal paper for publication.

As with the past STPs, the fourteenth volume expands upon the objectives that have been carried forward since the first ASTM Committee G04 STP was published in 1983. These objectives include:

- Review the current research on polymers and metals ignition and combustion;
- Overview principles of oxygen systems design and issues related to materials compatibility with oxygen;
- Contribute to the knowledge on the most current risk management concepts, practices, approaches, and procedures used by individuals and organization involved in the design, use, retrofitting, maintenance, and cleaning of oxygen systems;
- Review of accident/incident case studies related to oxygen systems and oxygen handling procedures;
- Provide research on new compounds or techniques to clean oxygen systems in order to make these systems safer for users;
- Provide the most current data related to the flammability and sensitivity of materials in oxygen-enriched atmospheres to designers, users, manufacturers and maintainers of oxygen components and systems and to support Committee G04's Technical and Professional Training Course on Fire Hazards in Oxygen Systems;

- Discuss enhancement, development, and use of standards sponsored by ASTM Committee G04 on Compatibility and Sensitivity of Materials in Oxygen Enriched Atmospheres; and
- Provide a readily accessible reference addressing oxygen compatibility.

The fourteenth volume consists of a group of peer-reviewed papers that were presented at the Committee G04's Fourteenth International Symposium held in San Antonio, Texas, USA, in April 2016. The volume consists of twenty-four papers on topics related to ignition and combustion of metals and non-metals, ignition and combustion of metals, oxygen compatibility of components and systems, analysis of ignition and combustion, failure analysis and safety, cleaning and cleanliness verification, new test methods, failure investigations, and includes aerospace, military, scuba diving, and industrial oxygen applications.

The papers presented in the fourteenth volume are arranged into five groups that offer a variety of valuable information. The first paper is a keynote address that was provided by Walter D. Downing of the Southwest Research Institute (SwRI) located in San Antonio, Texas. This address outlines how standards developed by ASTM play an important role in the research work conducted at SwRI.

The second group of papers consists of four papers focusing on test methods, including proposals for new test methods and modifications of existing test methods to improve the data derived from them. The first paper, submitted by NASA White Sands Test Facility, highlights improvements to autogenous ignition testing by using induction heating. The second paper, submitted by WHA International, focuses on the importance of statistical issues with the data generated by adiabatic compression testing. The third paper, submitted by NASA White Sands Test Facility, proposes improvements to ASTM G72 by improving the fuel to oxidizer ratios. The fourth paper, submitted by WHA International, deals with testing in low pressure oxygen applications, such as those used in hyperbaric systems.

The third group of papers consists of five papers focusing on cleaning methods, cleaning solvents, cleanliness verification, and contamination control. The first paper, submitted by NASA Marshall Space Flight Center, provides a thorough overview of the test program conducted by NASA to determine an adequate replacement for the current standard NASA oxygen system and hardware cleaning solvent, AK-225G, and the replacement solvent selected. The second paper, submitted by NASA Stennis Space Center, highlights the independent assessment program that NASA implemented for the AK-225G replacement selection effort. The third paper, submitted by NASA White Sands Test Facility, provides recommendations for improving the compatibility test methods that will ultimately lead to permitting the limited use within oxygen systems of materials that are flammable in oxygen. The fourth paper, submitted by NASA Marshall Space Flight Center, evaluates the risks that fibers and particulates pose in oxygen systems and the rationale behind the

existing cleanliness requirements. The fifth paper, submitted by WHA International, centers on the issues with non-volatile residues and their effect on the risks of fires in oxygen systems.

The fourth group of papers consists of five papers focusing on investigations of incidents and failures involving oxygen systems in the government and private industries. The first paper, submitted by the Indian Institute of Technology, provides an accurate and thorough evaluation of the fatal oxygen fire that occurred in 2012 at a steel plant in India. The second paper, submitted by NASA White Sands Test Facility, highlights a hydrocarbon fire that occurred inside one of their test chambers. The third paper, submitted by AEI Corporation of Colorado and WHA International, provides a detailed analysis of a fire that took place in a liquid oxygen bulk delivery tank. The fourth paper, submitted by WHA International, details the failure analysis of a gate valve fire within a liquid oxygen system. The fifth paper, submitted by WHA International, provides information about an incident involving a stainless steel plug valve that used silicone lubricant and an acetal resin valve seat.

The fifth group consists of nine papers that discuss research being conducted on materials and operations for oxygen systems. The first paper, submitted by Materion Corporation, highlights the qualities of ToughMet 3, a new material developed by Materion that may be well suited for oxygen system applications. The second paper, submitted by the ParisTech National Research Center in France, details the mechanisms and diagnostics for metals ignition in oxygen by utilizing a laser ignition mechanism. The third paper, submitted by Queensland University of Technology in Australia, provides a comparison of the combustion products of bulk aluminum burning in oxygen at both the normal gravity of Earth and a reduced gravity. The fourth paper, submitted by the National Academy of Sciences of Belarus in the Republic of Belarus, proposes steady-state jet modeling techniques for the combustion of cylindrical aluminum rods in high-pressure oxygen. The fifth paper, submitted by NASA White Sands Test Facility, highlights the methods to use containment boxes to mitigate fires in oxygen-enriched conditions. The sixth paper, submitted by Praxair Corporation, proposes a new promoted ignition-combustion test method for aluminum comprising heat exchangers. The seventh paper, submitted by the BAM Federal Institute for Materials Research and Testing in Germany, proposes a new international standard for oxygen endurance test for oxygen cylinder valve materials. The eighth paper, submitted by Queensland University of Technology in Australia, proposes a method to increase fire safety in oxygen systems by evaluating nonmetals in a near adiabatic compression process. The ninth paper, submitted by NASA White Sands Test Facility, details the facility's research on correlating the flammability of materials conducted at different oxygen concentrations and partial pressures.

The fourteenth volume of *Flammability and Sensitivity of Materials in Oxygen-Enriched Atmospheres* provides a diverse source of new information to air

separation industries, oxygen manufacturers, manufacturers of components for oxygen and other industrial gases service, manufacturers of materials intended for oxygen service, and users of oxygen and oxygen-enriched atmospheres, including aerospace, medical, industrial gases, chemical processing, steel and metals refining, as well as military, commercial, or recreational diving.
