

## BIBLIOGRAPHY

BY A. I. JOHNSON<sup>1</sup> AND J. P. GNAEDINGER<sup>2</sup>

This bibliography is presented to facilitate additional study of the reconnaissance and exploration methods discussed in this "Symposium on Soil Exploration." References were selected to cover a wide range of subjects and to be representative of a number of disciplines in addition to soil engineering—for example, geology, geophysics, hydrology, and soil science.

For maximum reader convenience, the references are listed under headings that indicate the main subject of the reference as it is related to soil exploration. This bibliography should not be

considered representative of all material available on any one of the subjects—the literature on these particular subjects is much too voluminous to attempt to compile a complete bibliography. However, the authors have attempted to present a list sufficiently representative of the full field of soil exploration so readers can pursue particular subjects in which they are interested. In addition, an attempt has been made to list some references which may lead to new, or at least more extensive, application of a particular method to soil exploration.
