ENVIRONMENTAL PRODUCT DECLARATION

High Density [HD] Polyiso Roof Cover Board

AMRIZE

GENERAL INFORMATION

This cradle-to-gate with options Environmental Product Declaration covers a polyiso high density (HD) cover board product produced at Florence Plant. The Life Cycle Assessment (LCA) was prepared in conformity with ISO 21930, ISO 14025, ISO 14040, and ISO 14044 and PCR Part A: Life Cycle Assessment Calculation Rules and Report Requirements (UL 10010, Version 4.0) and Services Part B: Roof Cover Board EPD Requirements (UL 10010-36, Version 1.0). This EPD is intended for business-to-business (B-to-B) audiences.

Product Category Rules for Building-Related Products and Services Part A: Life Cycle Assessment Calculation Rules and Report Requirements (UL 10010, Version 4.0) serves as the core PCR; Part B: Roof Cover Board EPD Requirements (UL10010-36, Version 3.0) serves as the sub-category PCR.

- Core PCR review was conducted by Lindita Bushi, PhD, (Chair) Athena Sustainable Materials Institute
 (lindita.bushi@athenasmi.org), Hugues Imbeault-Tétreault, Eng., M.A.Sc., Groupe AGÉCO (hugues.i-tetreault@groupeageco.ca) &
 Jack Geibig, Ecoform, LLC (jgeibig@ecoform.com).
- Sub-category PCR review was conducted by **Thomas P. Gloria**, PhD. (Chair), Industrial Ecology Consultants (<u>t.gloria@industrialecology.com</u>), **Christoph Koffler**, PhD, thinkstep (<u>christoph.koffler@thinkstep.com</u>), & **Andre Desjarlais**, Oak Ridge National Laboratory (<u>desjarlaisa@ornl.gov</u>).
- Independent verification of the declaration, according to ISO 21930:2017 and ISO 14025:2006.: □ internal ☑ external
- Third party verifier: Thomas P. Gloria, PhD. (t.gloria@industrial-ecology.com) Industrial Ecology Consultants
- For additional explanatory material: Manufacturer Representative: Sherrie MacWilliams (sherrie.macwilliams@amrize.com)
- This LCA EPD was prepared by: Coby Olson, Senior LCA and EPD Project Manager Climate Earth (www.climateearth.com)

Limitations:

- Environmental declarations from different programs (ISO 14025) may not be comparable.
- Comparison of the environmental performance of products using EPD information shall be based on the product's use and impacts at the building level, and therefore EPDs may not be used for comparability purposes when not considering the building energy use phase as instructed under this PCR.
- Full conformance with this PCR allows EPD comparability only when all stages of a life cycle have been considered. However,
 variations and deviations are possible". Example of variations: Different LCA software and background LCI datasets may lead to
 differences results for upstream or downstream of the life cycle stages declared.

PRODUCER

Amrize Building Envelope LLC delivers high-performance solutions that make the entire building envelope more sustainable for customers around the world. We are committed to raising the standards of building solutions by delivering superior quality and innovation while addressing industry needs.

Our offerings cover a comprehensive range of residential and commercial roofing, wall and lining systems, insulation, and waterproofing solutions for a variety of industries from construction to marine and aerospace. Our powerful portfolio brands include Elevate, Duro-Last, Malarkey Roofing Products, GenFlex, Gaco, and Enverge. Visit amrize.com to learn more.

Amrize's Florence, KY facility is ISO 9000 certified and manufactures GenFlex polyiso insulation boards and HD cover boards for use in commercial roofing systems. The 352,000 square foot plant opened in 2006.

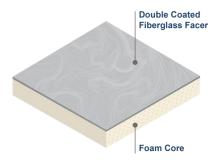

PRODUCT

This EPD covers polyiso HD cover board. HD cover boards are part of a roof system that is installed between insulation and the roofing membrane. HD cover boards add strength, protection and impact resistance to the roofing system and can enhance the roofs performance in a variety of ways including limiting external fire spread, reducing wind uplift, and contributing to the thermal and vapor barrier.

GenFlex HD ISO cover board consists of a closed cell polyiso foam core laminated to a specially coated, inorganic, fiberglass facer. With a 0.5 inch thickness, HD cover boards use proprietary foam technology to create a strong protecting barrier with a UL Class A rating for fire resistance. Additionally, the double coating of non-organic facing material on both sides of the insulation board meets ASTM D 3273 standards for mold resistance.

FIGURE 1

GenFlex HD ISO Cover Board

The products covered in this EPD have the following Physical and Performance Properties

(as illustrated in tables 1 & 2 below)

TABLE 1

Physical Properties (Sizes, thickness & Mass of different product presentation)

| Other Components | ~4.0 | | | | |

FUNCTIONAL UNIT

The functional unit as required by the PCR (Section 3.1 in Part B of the PCR) is:

The functional unit is 1 m² of installed roof cover board product, excluding other layers, ancillary materials, fasteners and adhesives required to achieve the expected performance.

TABLE 4 Functional Unit Properties

LIFE CYCLE ASSESSMENT

SYSTEM BOUNDARY

This EPD is a cradle-to-gate with options EPD, covering the life cycle stages indicated in Table 5.

TABLE 5

Life Cycle Product Stages

| PRODUCTION STAGE (MANDATORY) | | | | RUCTION AGE | USE STAGE | | | | END-OF-LIFE STAGE | | | | |
|------------------------------------|----------------------|---------------|-------------------|----------------|-----------|-------------|--------|-------------|-------------------|---------------------------------|---|------------------|-------------------|
| Extraction and upstream production | Transport to factory | Manufacturing | Transport to site | Installation | Use | Maintenance | Repair | Replacement | Refurbishment | De-construction / Demolition | Transport to waste processing or disposal | Waste processing | Disposal of waste |
| A1 | A2 | A3 | A4 | A5 | B1 | B2 | В3 | B4 | B5 | C1 | C2 | C3 | C4 |
| Х | X | Х | X | X | MND | MND | MND | X | MND | X | X | X | X |

NOTE: MND = module not declared; X = module included.

CUT-OFF

Items excluded from system boundary include:

- · production, manufacture and construction of manufacturing capital goods and infrastructure;
- production and manufacture of production equipment, delivery vehicles, and laboratory equipment;
- personnel-related activities (travel, furniture, and office supplies); and
- energy and water use related to company management and sales activities that may be located either within the factory site or at another location.

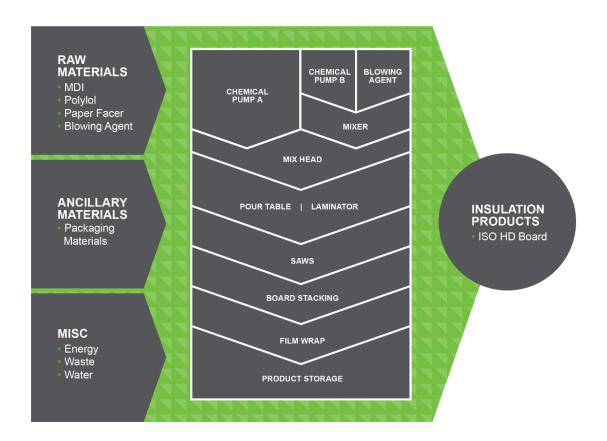

MANUFACTURING

The manufacturing process applied at Florence is depicted in the flow diagram presented in Figure 2. Within this stage, all manufacturing activities of HD cover boards, including packaging, manufacturing waste, and associated releases to the air, soil, ground, and surface water are included.

There are multiple raw material inputs in the manufacturing process. Raw materials are stored in onsite tanks. The chemicals from the Pump "A" side (MDI), the chemical pump "B" side (polyester polyol plus catalyst, surfactant, and flame retardant) and the blowing agent are pumped from raw materials storage tanks into process tanks. The "B" side and blowing agent combine with the "A" side at the mix head injected between the top and bottom facers on the pour table. The mixed chemicals react rapidly to form a closed-cell cover board sandwiched between the top and bottom facers. The HD cover board moves through a heated laminator, which controls thickness and aids in cell formation, curing, and facer adhesion. The HD cover board exits the laminator and is fed through saws that trim the board to the desired width and length. After processing, the HD cover boards are stacked and wrapped in film to be stored.

The finished HD cover board are placed on a pallet made of scrap HD polyiso insulation board slats. After being labeled, the pallets are moved via fork truck to a warehouse area for storage and eventual loading onto trucks for shipment.

After manufacturing (A1-A3) processes, the installation phase covers both transport to site (A4) and Installation (A5). For modeling this process, some assumptions are considered. For example, the HD cover boards are transported in average 169 miles to its installation site in typical diesel trucks with high capacity but very low weight due to the product's low density. After being transported to the site, the pallets are unloaded from the truck to the rooftop using a diesel crane. Then, the HD cover boards are installed manually through a mechanical attachment procedure involving fasteners and fastening plates and necessary equipment to support the procedure. Finally, the waste scrap from installation is collected and transported to a local landfill for disposal. Disposal of installation waste scrap to a local landfill was modeled as 7% of total volume, according to PCR specific rules.

B1 - B5 USE STAGE

As part of a system, the HD cover boards are covered and protected by a roofing membrane. The roof membrane, when installed properly and adequately maintained, protects the HD cover board from the environmental elements and weather during its use. Therefore, it is expected that the HD cover board will not sustain damage that affects its performance and function. As defined in the PCR, the Building Estimated Service Life (ESL) is 75 years. Assuming that the whole system is well installed and maintained, the HD cover board will serve its functional purpose for the 75-year life span of the building. However, usually at least one reroofing activity will take place during the 75-year building ESL. This practice establishes a 40-year RSL for HD cover boards, which brings a 1.9 replacement cycle (see further description to support this value in section "Scenarios and additional technical information" below).

C1 - C4 END-OF-LIFE STAGE

At the end of building service life and during roof replacement, the HD cover boards may be reused, recovered and repurposed, or disposed of. This study does not take reuse and recovery into account, and it is assumed that HD cover board is removed when the building is decommissioned and disposed of in a landfill, for which an average distance and specific end of life LCI is applied.

LIFE CYCLE ASSESSMENT RESULTS

This declaration is cradle-to-gate with options. As discussed in the Life Cycle Assessment Scope and Boundaries Section, information modules B1, B2, B3, B5, B6, B7, C1 and C3 do not contribute to impacts and are declared as zero. Optional Module D – Benefits and Loads Beyond the System Boundary – is not included in this LCA study. Only relevant stages are presented with results, to make it easier to follow.

| * Emerging I CA impact categories and | | | | | | | | | | |

^{*} Emerging LCA impact categories and inventory items are still under development and can have high levels of uncertainty that preclude international acceptance pending further development. Use caution when interpreting data in these categories. The following optional indicators are not reported and have high levels of uncertainty: Land use related impacts, toxicological aspects, and emissions from land use change

^{**}Only EPDs prepared from cradle-to-grave life-cycle results and based on the same function, quantified by the same functional unit, and taking account of replacement based on the product reference service life (RSL) relative to an assumed building service life, can be used to assist purchasers and users in making informed comparisons between products.

¹ GWP 100; 100-year time horizon GWP factors are provided by the IPCC 2013 Fifth Assessment Report (AR5). CO₂ from biogenic secondary fuels used in kiln are climate-neutral (CO₂ sink = CO₂ emissions), ISO 21930, 7.2.7.

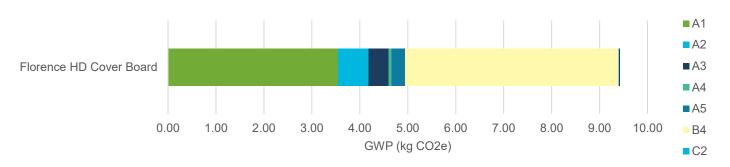

² Calculated per ACLCA ISO 21930 Guidance.

INTERPRETATION

The GWP impacts for each information module are shown below in Figure 3.

FIGURE 3

Comparison of GenFlex HD ISO Cover Board GWP impacts across information modules

As evidenced by Figure 3, most of the GWP impacts for these cover boards come from the modules A1 and B4. Module B4, the replacement stage, accounts for 47.3% of the total GWP impact of the product, which is understandable as this module accounts for 90% of the impacts from all other modules. Module A1 accounts for 37.7% of the total GWP impact of the product due to the upstream production of the materials used in the production of the HD cover boards.

While GWP is specifically assessed in Figure 3, several other impact categories are distributed in a similar fashion.

LIMITATIONS

Life cycle impact assessment (LCIA) results are relative expressions and do not predict impacts on category endpoints, the exceeding of thresholds, safety margins, or risks.

Emerging LCA impact categories and inventory items are still under development and can have high levels of uncertainty that preclude international acceptance pending further development. Use caution when interpreting data from the following categories:

- renewable primary energy resources as energy (fuel), (RPRE)
- renewable primary resources as material, (RPRM)
- nonrenewable primary resources as energy (fuel), (NRPRE)
- nonrenewable primary resources as material (NRPRM)
- secondary materials (SM)
- renewable secondary fuels (RSF)
- nonrenewable secondary fuels (NRSF)
- recovered energy (RE)
- abiotic depletion potential for non-fossil mineral resources (ADP_{elements})
- hazardous waste disposed (HWD)
- nonhazardous waste disposed (NHWD)
- high-level radioactive waste (HLRW)
- intermediate and low-level radioactive waste (ILLRW)
- components for reuse (CRU)
- materials for recycling (MR)
- materials for energy recovery (MER); and
- recovered energy exported from the product system (EE).
