

Spray Polyurethane Foam Insulation

ENVIRONMENTAL PRODUCT DECLARATION

Open Cell Spray Foam

GENERAL INFORMATION

This cradle-to-grave Environmental Product Declaration covers a spray foam product produced at the Spring, TX and Waukesha, WI facilities. The Life Cycle Assessment (LCA) was prepared in conformity with ISO 21930, ISO 14025, ISO 14040, and ISO 14044 and PCR Part A: Life Cycle Assessment Calculation Rules and Report Requirements (UL 10010, Version 4.0) and Part B: Building Envelope Thermal Insulation EPD Requirements (UL10010-1, Version 3.0). This EPD is intended for business-to-business (B-to-B) audiences.

Product Category Rules for Building-Related Products and Services Part A: Life Cycle Assessment Calculation Rules and Report Requirements (UL 10010, Version 4.0) serves as the core PCR; Part B: Building Envelope Thermal Insulation EPD Requirements (UL10010-1, Version 3.0) serves as the sub-category PCR.

- Sub-category PCR review was conducted by Thomas Gloria, Ph.D. (t.gloria@industrial-ecology.com) Industrial Ecology Consultants
- Independent verification of the declaration, according to ISO 21930:2017 and ISO 14025:2006.: □ internal ✓ external
- Third party verifier Thomas P. Gloria, Ph.D. (t.gloria@industrial-ecology.com) Industrial Ecology Consultants
- For additional explanatory material Manufacturer Representative: Sherrie MacWilliams (sherrie.macwilliams@amrize.com)
 This LCA EPD was prepared by May Ang LCA and EPD Project Manager Sphera (www.sphera.com)
- EPDs are comparable only if they comply with ISO 21930 (2017), use the same sub-category PCR where applicable, include all relevant information modules and are based on equivalent scenarios with respect to the context of construction works.

Limitations:

- Environmental declarations from different programs (ISO 14025) may not be comparable.
- Comparison of the environmental performance of products using EPD information shall be based on the product's use and impacts at the building level, and therefore EPDs may not be used for comparability purposes when not considering the building energy use phase as instructed under this PCR.
- Full conformance with this PCR allows EPD comparability only when all stages of a life cycle have been considered. However, variations and deviations are possible". Example of variations: Different LCA software and background LCI datasets may lead to different results for upstream or downstream of the life cycle stages declared.

PRODUCER

Enverge is a leading manufacturer in spray foam insulation (SPF) solutions, dedicated to enhancing the performance and efficiency of modern buildings. We specialize in advanced, multi-functional insulation materials designed to create superior building envelopes. Our products, including both open-cell (like EasySeal™ .5 and SucraSeal®) and closed-cell (like OnePass® and NexSeal™) foams, are engineered to address critical building science needs, such as achieving exceptional thermal performance and creating seamless air barriers.

PRODUCTS

Enverge Open Cell Spray Foam, including products like **Enverge EasySeal™** and **bio-based SucraSeal®**, offers a unique approach to insulation. This lightweight, expansive foam excels at creating a highly effective air barrier, sealing every gap and cavity to prevent air leakage and minimize heat loss. With R-values typically around R-3.7 to R-3.8 per inch, open-cell foam provides excellent thermal performance while also delivering significant sound-dampening benefits, making it ideal for interior walls, floor joists, and attic applications where sound control and a breathable building envelope are desired. It's a versatile solution for enhancing comfort and energy efficiency in a wide range of residential and commercial projects.

FIGURE 1
Open Cell Spray Foam

The products covered in this EPD have the following Physical and Performance Properties (as illustrated in tables 1 - 3 below)

All SPF products must meet numerous performance requirements to comply with building codes. The details of these requirements are described in specific tests listed in consensus standards for material performance and code compliance. Table 1 outlines the properties of Enverge Open Cell Spray Foam, **Enverge EasySeal**TM and **bio-based SucraSeal**®.

TABLE 1
Physical Properties

TYPICAL PROPERTIES						
STANDARD TYPE	Testing Method	EASYSEAL .5	SUCRASEAL			
APPARENT DENSITY	ASTM D-1622	0.40 – 0.45 lbs/ft ³ (nominal)	0.40 - 0.45 lbs/ft ³ (nominal)

DIMENSIONAL STABILITY, -40°F	ASTM D-2126 (Easyseal) ASTM D-6866 (Sucraseal)	< 5% Change	17%			
DIMENSIONAL STABILITY, +200°F	ASTM D-2126	< 5% Change	< 3% Change			

TYPICAL PROPERTIES						
STANDARD TYPE	Testing Method	EASYSEAL .5	SUCRASEAL			
DIMENSIONAL STABILITY, +158°F & 100%RH	ASTM D-2126	< 5% Change	< 3% Change			
IGNITION BARRIER	ICC ES AC377 Appendix X	Pass DC-315 4 mils wft NO BURN THB PLUA 6MILS	< 10% Change			
THERMAL BARRIER	NFPA 286	Pass tpr2 20 mils wft Pass dc-315 14 mils wft Flame control 60-60a 14 mils wft	Pass No Coating			

These values are typical. However values will vary and should not be considered part of the product specifications. It is imperative that the trained applicator read and understand this technical data sheet and SDS to process the material correctly and understand environmental and equipment limitations.

TECHNICAL REQUIREMENT

Spray foam insulation products must be installed in compliance with building codes. Nearly all jurisdictions have adopted a version of the following building codes:

- International Code Council (ICC) International Residential Code (IRC) For 1 and 2 family dwellings
- International Code Council (ICC) International Building Code (IBC) For multifamily dwellings, as well as commercial, institutional and industrial buildings.
- International Code Council (ICC) International Energy Conservation Code (IECC) Providing envelope energy efficiency requirements for all buildings.
- American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) Standard 90.1- Energy Standard for Sites and Buildings Except Low-Rise Residential Buildings
- American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) Standard 90.2- Energy-Efficient Design of Low-Rise Residential Buildings

To meet code requirements, open cell products must meet minimum performance requirements, demonstrated by laboratory testing using approved test methods. These tests are performed by third-party laboratories and test data typically submitted to a certification agency for evaluation of the results and the creation of an independent code compliance report for the product. Certification agencies also perform regular quality control testing from random samples taken from the manufacturer's facilities.

There are two guides that are followed by these certification bodies to collect and evaluate data to generate code compliance reports:

- ICC 1100 Standard for Spray-applied Polyurethane Foam Plastic Insulation (2021)
- IAPMO/ANSI ES1000 Building Code Compliance Spray-Applied Polyurethane Foam (2020)

TABLE 2

Testing Requirements per ICC 1100 and IAPMO ES1000 Standards

TESTING REQUIREMENTS PER ICC 1100 AND IAPMO ES1000 STANDARDS						
Property	Measurement	Test Method	Requirement			
Thermal Resistance	R-value at thickness or thermal resistance	ASTM C177-19 Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus, ASTM C518-21 Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus, OR ASTM C1363-24 Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus	Report			
Air Permeance	Thickness where foam is air impermeable	ASTM E283/E283M-19 Standard Test Method for Determining Rate of Air Leakage Through Exterior Windows,	Report minimum thickness where ai impermeable			

TE	STING REQUIREMENTS PER	ICC 1100 AND IAPMO ES1000 STAND	ARDS		
Property	Measurement	Test Method	Requirement		
		Skylights, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen OR ASTM E2178-21a Standard Test Method for Determining Air Leakage Rate and Calculation of Air Permeance of Building Materials			
Water Vapor Permeance	Thickness where foam meets Class I, II or III vapor retarder performance	ASTM E96/E96M-24 Standard Test Methods for Gravimetric Determination of Water Vapor Transmission Rate of Materials (Method A)	Report thickness at vapor retarder class I, II or III.		
Density	Mass density of foam	ASTM D1622-20 Standard Test Method for Apparent Density of Rigid Cellular Plastics	Report		
Surface Burning Characteristics	Flame Spread Index	ASTM E84-24 Standard Test Method for Surface Burning Characteristics of Building Materials	75 or less		
Surface Burning Characteristics	Smoke Developed Index	ASTM E84-24 Standard Test Method for Surface Burning Characteristics of Building Materials	450 or less for insulation, unlimited for roofing		
Thermal Barrier Testing	Pass fire test with prescriptive thermal barrier for thickness over 4"	NFPA 286, FM 4880, UL 1040 or UL1715	Pass 15 minute criteria		
Alternate Thermal Barrier Assembly	Pass fire test with specific covering or coating	NFPA 286, FM 4880, UL 1040 or UL1715	Pass 15 minute criteria		
Ignition Barrier Testing	Pass fire test with or without covering or coating	Various special test methods	See standard for details		

MATERIAL COMPOSITION

The side-A is made from a blend of polymeric methylene diphenyl diisocyanate (MDI). Side-B is a mixture of polyester and polyether polyols, flame retardants, blowing agents, catalysts, and other additives that, when mixed with side-A, creates foam that can be applied for insulation. Due to company confidentiality, the industry average side-B formulation is displayed in Table 3.

While some of the ingredients may be classified as hazardous, per the Resource Conservation and Recovery Act (RCRA), Subtitle C, the product as installed and ultimately disposed of is not classified as a hazardous substance, as hazardous ingredients are rendered chemically inert after installation.

There are no toxic materials or hazardous wastes directly associated with either the manufacturing of these components or the installation of the spray foam systems.

TABLE 3 Industry Closed cell, HFO Side-B Formulations

CHE	MICAL (% COMPOSITION)	INDUSTRY OPEN CELL
Dahaal	Polyester	32
Polyol	Compatibilizer	13
Fire Retardant	TCPP	25
Blowing Agent	Reactive (H2O)	20
Catalyst	Catalyst, amine	9
Surfactant	Silicone	1

APPLICATION

Open cell products are commonly used in residential, light commercial, commercial, institutional, and certain industrial applications. They are commonly applied to the interior side of the building envelope as an insulation and air-sealing material.

FUNCTIONAL UNIT

The functional unit as required by the PCR (Section 3.1 in Part B of the PCR) is:

One square meter (1 m²) of installed insulation material with a thickness that gives an average thermal resistance $R_{SI} = 1 \text{ m}^2 \cdot \text{K/W}$ (R = 5.68 hr·ft²·°F/Btu) and with a building service life of 75 years (packaging included).

As requested by the PCR, the Functional Unit of this LCA is expressed in Table 4.

TABLE 4

Functional Unit Properties

FUNCTIONAL UNIT (FU)	VALUE	SI UNIT	VALUE	IMPERIAL UNIT

 $1m^2$ of insulation material with a thickness that gives an average thermal resistance R_{SI} =1 m^2K/W

Mass	0.27	kg	0.59	lbs
Thickness to achieve FU	0.04	m	1.53	inch

^{* 0.59} lbs in the mass of insulating foam that fulfills the required RSI value, which excludes the mass of

LIFE CYCLE ASSESSMENT

SYSTEM BOUNDARY

This EPD is a cradle-to-grave EPD, covering A1-C4 stages of the life cycle.

TABLE 5

Life Cycle Product Stages

	DUCTION ST			RUCTION AGE			USE STAGE				END-OF-LI	FE STAGE	
Extraction and upstream production	Transport to factory	Manufacturing	Transport to site	Installation	Use	Maintenance	Repair	Replacement	Refurbishment	De-construction / Demolition	Transport to waste processing or disposal	Waste processing	Disposal of waste

X	X	X	Χ	Χ	X	Χ	X	X	Χ	X	Χ	X	X

NOTE: MND = module not declared; X = module included.

CUT-OFF

Items excluded from system boundary include:

- production, manufacture and construction of manufacturing capital goods and infrastructure;
- production and manufacture of production equipment, delivery vehicles, and laboratory equipment;
- personnel-related activities (travel, furniture, and office supplies); and
- energy and water use related to company management and sales activities that may be located either within the factory site or at another location.

DATA SOURCES

The LCA model was created using the LCA for Experts (LCA FE) v10.9 software system for life cycle engineering, developed by Sphera (Sphera, 2024). Background life cycle inventory data for raw materials and processes were obtained from the Sphera Managed LCA content (MLC) 2024.2 database. Primary manufacturing data were provided by Amrize.

DATA QUALITY

A variery of tests and checks were performed by the LCA practitioner throughout the project to ensure high quality of the completed LCA. Checks in cluded an extensive internal review of the project-specific LCA models developed as well as the background data used. A full data quality assessment is documented in the background report.

Temporal coverage

The data are intended to represent the production during the 2023 calendar year. As such, primary data was provided for 12 consecutive months during the 2023 calendar year. Background data for upstream and downstream processes are obtained from the Sphera MLC databases 2024.2 and are representative of the years 2017-2023.

Geographical coverage

This background LCA represents Amrize's production in the US. Primary data are representative of the Spring, TX and Waukesha, WI facilities. Regionally specific datasets were used to represent each manufacturing location's energy consumption. Proxy datasets were used as needed for raw material inputs to address lack of data for a specific material or for a specific geographical region. These proxy datasets were chosen for their technological representativeness of the actual materials.

Technological coverage

Data on material composition were developed using specific side-B formulation. Manufacturing data were collected directly from Amrize. Waste, emissions, and energy use are calculated from reported annual production during the reference year.

PERIOD UNDER REVIEW

Primary data collected represents production during the 2023 calendar year. This analysis is intended to represent production in 2023.

ALLOCATION

Primary data collected represent production during the 2023 calendar year. This analysis is intended to represent production in 2023. Multi-output allocation follows the requirements of ISO 14044, section 4.3.4.2 (ISO, 2006a; ISO, 2006b). When allocation becomes necessary during the data collection phase, the allocation rule most suitable for the respective process step was applied. Energy and waste outputs were allocated based mass allocation.

The background MDI dataset used in the LCA study, which was developed by the European diisocyanates and polyols producers' association known as ISOPA is based on a combination of mass and elemental allocation approach (European Diisocyanate and Polyol Producers Association (ISOPA), 2021). This also aligns with the 2022 LCA study conducted by the American Chemistry Council. (American Chemistry Council, 2022) and the SPFA industry EPDs (SPFA, 2024).

The cut-off allocation approach is adopted in the case of any post-consumer and post-industrial recycled content, which is assumed to enter the system burden-free. Only environmental impacts from the point of recovery and forward (e.g., inbound transports, grinding, processing, etc.) are considered.

MANUFACTURING

The manufacturing process is depicted in the flow diagram presented in Figure 2. The manufacturing process of Enverge Spray Foam includes packaging, manufacturing waste and associated releases to the air, soil, group and surface water.

Spray Foam is applied in the field via a two-part system. The A-side (MDI) is a purchased component that is shipped in tandem with the B-side as a final product. The B-side (includes all or in part: polyols, surfactants, fire retardants, solvents, blowing agents, catalysts, cell openers) is manufactured by raw materials that originate from chemicals stored in onsite bulk storage tanks and packaged chemicals that are transferred from standalone containers to a mixing vessel at the manufacturing location. The B-side manufactured polyol will generate a HFO Formulation for open cell.

Once the B-side raw materials have been combined in the vessel and mixed appropriately, it is packaged into the desired container size. The manual filled containers will be sealed suitably, labelled and secured on pallets with its A-side purchased component. The A-side MDI and B-side manufactured polyol will be transferred to a warehouse area for storage as a complete finished product. Eventually this product will be loaded on trucks for shipment.

The finished products are packaged in unpressurized containers of varying types, most commonly in 55-gallon (208 L) steel drums and are loaded onto pallets. In this study, it is assumed that the empty chemical containers are properly cleaned and taken to a drum recycler.

Disposal of packaging materials is modeled in accordance with the assumptions outlined in Part A of the PCR (UL Environment, 2022). Plastic based packaging is disposed in landfill (68%), incineration (17%), and recycled (15%). Metal based packaging is disposed in landfill (34%), incineration (9%), and recycled (57%). Paper based packaging is disposed in landfill (20%), incineration (5%), and recycled (75%).

After manufacturing (A1-A3) processes, the installation phase covers both transport to site (A4) and Installation (A5). Table 6 and 7 provide more information about modules A4 and A5. The tables report results per functional unit.

Final products are distributed via container truck, which are fueled by diesel. These final products are either directly to customers, or first to warehouse, prior to being sent to customers. Table 7 details distribution assumptions for finished product. After being transported to the site, the packs are unloaded from the truck to the rooftop using a diesel crane. Then, the boards are installed manually through a mechanical attachment procedure involving fasteners and fastening plates and necessary equipment to support the procedure. Finally, the waste scrap from installation is collected and transported to a local landfill for disposal.

For SPF with physical blowing agents, this study assumes 10% of the installed blowing agent is released to surrounding air during the installation phase. Discarded foam from installation also experiences blowing agent release while in landfill. Disposal of packaging materials is modeled in accordance with the assumptions outlined in Part A of the PCR (UL Environment, 2022). All ancillary installation materials are assumed to be sent to landfill. For open cell spray foam, the blowing agent is water and results in no environmental impact.

FIGURE 2

Process Flow Diagram of Spray Foam Manufacturing

Waste materials at the construction site before waste processing, generated by product installation	0.0013	kg
Output materials resulting from on-site waste processing (specified by route; e.g. for recycling, energy recovery and/or disposal)	-	kg
Biogenic carbon contained in packaging	0.0006	kg CO ₂
Direct emissions to ambient air, soil and water	-	kg
VOC content	-	μg/m³

B1 - B5 USE STAGE

As this study only looks at the life cycle of spray foam insulation, and not the building, the use phase only contains the emissions of any chemicals off-gassed from the foam. This study assumes 24% of the original chemical blowing agent is off-gassed over a 75-year lifetime (Honeywell International). However for open cell spray foam, the blowing agent is water and results to no environmental impact reported in its use phase (module B1).

Table 8 provides information about the product's reference service life per functional unit.

Reference Service Life

Name	Value	Unit
Direct emissions to ambient air, soil and water	-	kg

C1 - C4 END-OF-LIFE STAGE

When the building is decommissioned, it is assumed that only manual labor is involved to remove the foam. Waste is assumed to be transported 30 miles (48 km) to the disposal site. The spray foam is assumed to be landfilled at end-of-life, as is typical for construction and demolition waste in the US. This study assumes 16% of the original physical blowing agent is emitted at this stage in the life cycle. It is further assumed the spray foam is inert in the landfill and 50% of the blowing agent remains in the product after disposal. (Kjeldsen & Jensen, 2001). Table 9 provides more information about modules C1 to C4 (end of life). The table reports results per functional unit.

TABLE 9
End of life (C1-C4)

Assumptions for scenario development (descripti disposal method and	Landfill			
Collection process (specified by type)	Collection process (specified by type) Collected with mixed construction waste			
Recovery (specified by type)	Landfill	0.27	kg	
Disposal (specified by type)	Product or material for final deposition	0.27	kg	
Removals of biogenic carbon	Removals of biogenic carbon (excluding packaging)			

LIFE CYCLE ASSESSMENT RESULTS

This declaration is cradle-to-grave and all information modules are declared. As discussed in the Life Cycle Assessment Scope and Boundaries Section, Modules B2, B3, B4, B5, B6, B7, C1 and C3 do not contribute to impacts and are declared as zero. Optional Module D – Benefits and Loads Beyond the System Boundary – is not included in this LCA study. Only relevant stages are presented with results, to make it easier to follow.

LCA INTERPRETATION

Figure 3 presents the results for the environmental performance of 1 m^2 of installed product with a thickness that provides a thermal resistance of 1 m^2 ·K/W (5.68 hr·ft²-°F/Btu).

It is clear from the figure that raw materials (A1) have the largest contribution on the environmental footprint, followed by installation (A5) and manufacturing (A3). Transportation modules (A2, A4, and C2) have a cumulative contribution of 0% to 5% across the impact categories. As open cell SPF uses a reactive blowing agent (water), use (B1) has no impact reported, and end-of-life (C4) have a negligible impact (< 2%) overall.
